

```
<?php
$numbers = array(1, 2, 3, 4, 5);
$len=count($numbers);
for($i=0; $i<$len; $i++){
    //shows the value for each iteration
    if($numbers[$i]%2==0){
        echo "$numbers[$i] is an even number <br>";
    }
}
?>
```

```
2 is an even number
4 is an even number
```

I took the length of the array and used it as the condition for my if statement. My loop iterates from 0 to the length of the array, and checks if the index of the array to see if that number divided by 2 has a remainder. If not, then I know that it is divisible perfectly by 2 and therefore is an even number. Then, it prints the even number.
